1 Operating instructions

1.1 Using this manual

- Read this operating manual thoroughly before using the device for the first time. Also observe the instructions for use of the accessories.
- This operating manual is part of the product. It must always be kept easily accessible.
- Enclose this operating manual when transferring the device to third parties.
- You will find the current version of the operating manual for all available languages on our website at www.eppendorf.com/manuals.
- This operating manual applies to devices with software version 2.06.00 or higher.

1.2 Danger symbols and danger levels

1.2.1 Danger symbols

The safety instructions in this manual have the following danger symbols and danger levels:

<table>
<thead>
<tr>
<th>Biohazard</th>
<th>Explosive substances</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric shock</td>
<td>Toxic substances</td>
</tr>
<tr>
<td>Hazard point</td>
<td>Material damage</td>
</tr>
</tbody>
</table>

1.2.2 Danger levels

| DANGER | Will lead to severe injuries or death. |
| WARNING | May lead to severe injuries or death. |
| CAUTION | May lead to light to moderate injuries. |
| NOTICE | May lead to material damage. |

1.4 Glossary

A

Additional volume
The total of the remaining stroke and the reverse stroke.

B

Blow out
Movement of the piston into the lower position to blow out any residual liquid from the pipette tip. During pipetting operations, the liquid from the blow-out is part of the dispensing volume. During reverse pipetting operations, the liquid is not part of the dispensing volume.

C

Cycle
Together, the upward piston movement (liquid aspiration) and downward piston movement (liquid dispensing) form a cycle.

F

Free jet dispensing
Dispensing of liquid without the dispensing tip (pipette tip, dispenser tip) touching the tube inner wall.

I

Increment
Step size or resolution. The smallest possible change by which a value can be increased.

ISO 8655
The standard defines limit values for the systematic error, the random error and the test methods for dispensers.

L

Li-polymer rechargeable battery
Special configuration of a lithium-ion battery. Like rechargeable lithium-ion batteries, rechargeable lithium-polymer-batteries have a very high charging capacity and a long service life. The special encapsulation of the rechargeable lithium-polymer-battery makes it lighter than rechargeable lithium-ion batteries.

N

Nominal volume
The maximum dispensing volume of a dispensing system specified by the manufacturer.
R

**Remaining stroke**
Liquid reserve. The liquid which remains after all dispensing steps have been completed.

**Reverse stroke**
After liquid aspiration, the piston is moved to a defined initial position. Liquid is dispensed during the piston movement. The reverse stroke is not a dispensing step.

V

**Vapor pressure**
This term refers to the pressure exerted by the vapor of a material (solid or liquid) in an enclosed container. The vapor is in equilibrium with the solid or liquid phase of the material. The vapor pressure increases when the temperature increases. Each pure liquid has a vapor pressure of 1013 hPa (mbar) at boiling point. Volume errors caused by high vapor pressure can be reduced by prewetting the tip.

**Viscosity**
Viscosity describes the viscosity of liquids and suspensions. The dynamic or absolute viscosity is indicated in Pa·s or in mPa·s. In older literature, the unit P or cP is used (1 mPa·s corresponds to 1 cP). At room temperature, a 50% glycerol solution has a viscosity of approx. 6 mPa·s. As the glycerol concentration increases, viscosity increases considerably. Absolutely anhydrous glycerol has a viscosity of approx. 1480 mPa·s at room temperature.
2 Safety

2.1 Intended use

The Xplorer/Xplorer plus is a lab device intended for dispensing liquids in the volume range from 0.5 μL to 10 mL in combination with matching pipette tips. In-vivo applications (in or on the human body) are not allowed.

Only appropriately qualified personnel are allowed to use the Xplorer/Xplorer plus. All users must have read the operating manual carefully and familiarized themselves with the device's mode of operation.

2.2 Warnings for intended use

**DANGER! Risk of explosion.**
- Do not operate the device in areas where explosive substances are handled.
- Do not use this device to process any explosive or highly reactive substances.
- Do not use this device to process any substances which may generate an explosive atmosphere.

**WARNING! Damage to health due to infectious liquids and pathogenic germs.**
- When handling infectious liquids and pathogenic germs, observe the national regulations, the biosafety level of your laboratory, the material safety data sheets, and the manufacturer's application notes.
- Wear your personal protective equipment.
- For comprehensive regulations about handling germs or biological material of risk group II or higher, please refer to the "Laboratory Biosafety Manual" (source: World Health Organization, Laboratory Biosafety Manual, the current edition).

**WARNING! Damage to health due to toxic, radioactive or aggressive chemicals.**
- Wear your personal protective equipment.
- Observe the national regulations for handling these substances.
- Observe the material safety data sheets and manufacturer's application notes.
WARNING! Personal injury due to incorrect handling of the rechargeable battery.

- Only use rechargeable batteries supplied by Eppendorf.
- Never pierce, crush or throw the rechargeable battery.
- Only use the rechargeable battery in the supplied device.
- Do not touch a leaking rechargeable battery.
- Do not use a damaged rechargeable battery.
- Dispose of rechargeable batteries in accordance with the legal requirements.

CAUTION! Danger to people due to grossly negligent use.

- Never point the opening of the device towards yourself or others.
- Only initiate liquid dispensing if it is safe to do so.
- For all dispensing tasks, make sure that you are not endangering yourself or anyone else.

CAUTION! Poor safety due to incorrect accessories and spare parts.

The use of accessories and spare parts other than those recommended by Eppendorf may impair the safety, functioning and precision of the device. Eppendorf cannot be held liable or accept any liability for damage resulting from the use of accessories and spare parts other than those recommended, or from the improper use of such equipment.

- Only use accessories and original spare parts recommended by Eppendorf.

NOTICE! Damage to the device due to missing pipette tips.

- Use the pipette with fitted pipette tips only.

NOTICE! Carry-over, contamination and incorrect dispensing results due to the incorrect use of pipette tips.

The pipette tips are for single use only. Prolonged use can have a negative impact on dispensing tasks.

- Only use the pipette tips once.
- Do not use autoclaved ep Dualfilter T.I.P.S. for dispensing.

NOTICE! Damage to device due to penetration of liquid.

- Only immerse the pipette tip in the liquid.
- Do not put the pipette down when the pipette tip is filled.
- The pipette itself may not come into contact with the liquid.
Product description
Eppendorf Xplorer®/Eppendorf Xplorer® plus
English (EN)

2.3 Information on product liability
In the following cases, the designated protection of the device may be affected. Liability for any resulting damage or personal injury is then transferred to the owner:

- The device is not used in accordance with the operating manual.
- The device is used outside of its intended use.
- The device is used with accessories or consumables that are not recommended by Eppendorf.
- The device is maintained or repaired by persons not authorized by Eppendorf AG.
- The user makes unauthorized changes to the device.

3.2 Features

The Xplorer pipettes are motor-driven and electronically-controlled piston-stroke pipettes for aspirating and dispensing liquids according to the air cushion principle. The Xplorer pipette family includes single-channel and multi-channel pipettes (8 or 12 channels). Depending on the Xplorer pipette, volumes from 0.5 μL to 10 mL can be dispensed. The liquid is aspirated into a pipette tip which has been fitted to the Xplorer pipette.

The central operating control of the Xplorer pipette is a rocker switch. The color of the rocker switch varies according to the volume range of the Xplorer Pipette. The rocker switch has different functions during dispensing and when editing the dispensing parameters. It can either be pushed upwards or downwards.

The lower parts of the Xplorer pipettes can be autoclaved.

On all Xplorer pipettes with a nominal volume of 10 μL to 1000 μL, the tip cone has a spring-loading action when a pipette tip is attached.

A protection filter can be inserted in 5 mL and 10 mL Xplorer pipettes to protect the tip cone against liquids.
3.3  Product overview

Fig. 3-1:  Single-channel pipette and multi-channel pipette
3.4 Display

The brightness of the display can be changed in the options. The display dims during usage intervals and switches off after a prolonged usage interval. Move the Xplorer pipette to switch the display back on.

The adjustment can be changed in the options. Visit our webpage for further information www.eppendorf.com/manuals.

**Volume**

Acoustic signal
The selected volume for the acoustic feedback can be set in the options. 
If the volume has been set to 0, no loudspeaker symbol is displayed.

**Rechargeable battery**

Rechargeable battery fully charged.

Rechargeable battery partially discharged.

Rechargeable battery almost discharged. Rechargeable battery must be charged.
3.4.2 Status bar
The selected operating mode is displayed here during operation. In edit mode, the name of the parameter to be edited is displayed.

3.4.3 Main field
All parameters of the operating mode are displayed simultaneously during dispensing. A black arrow ▼▲ indicates the direction of the next piston movement.
In edit mode, the parameter to be edited is marked in red.
Some of the dispensing parameters in the main field include:
• Dispensing volume
• Speed: 8 speeds for aspiration and dispensing
• Counter Number of conducted dispensing steps. Optional setting in the Pip mode

3.4.4 Footer
Assignment of the softkeys with variable functions.

Some of the softkeys in the footer are:
• Edit: Open the edit mode.
• Next: Select next parameter.
• End: Exit the edit or help mode.
• Help: Show help.
• History: Display the last dispensing settings of the accessed mode.

The right softkey can be assigned to Help or History. The assignment of the softkey can be defined in the options (Opt). The softkey is assigned to Help when delivered.
If the right Help softkey is activated, the softkey can be used to display information on the selected operating mode.
If the History softkey is activated, it can be used to call the most recently executed dispensing operations.
3.5 Operating controls

</tr>
</tbody>
</table>

3.6 Principle of operation

Every pipette is equipped with different operating modes and a primary mode for configuring the pipette. The adjustable parameters and operational procedures differ in the operating modes.

During operation, the piston in the pipette is moved according to how the rocker is actuated. When you press the rocker up, the piston in the pipette moves up. Liquid is aspirated into the attached pipette tip. When you press the rocker down, the piston in the pipette moves down. The liquid in the pipette tip is dispensed.

Press the Edit softkey to open the edit mode of the selected operating mode. Here, you can use the rocker to change the parameter that is outlined and marked red.

Special operating sequences with an electric pipette are possible with dispensing using the rocker. For example, you can cancel a piston movement in the Dis, Pip and P/M modes at any time by pressing the rocker in the other direction. You can cancel the piston movement in the Ads and Man modes by releasing the depressed rocker. After the piston has been stopped, you can continue the aspiration or dispensing process by pressing the rocker in the corresponding direction.

If the piston is in the basic position, you can repeat the blow-out (Blow) at any time by pressing the rocker down.

The pipette software is available in several languages. To change the language, change the Language parameter in the options.

3.10 RFID chip

The Eppendorf dispensing device is equipped with a RFID chip. The RFID chip can be read and written with the TrackIT reader and TrackIT software. The scanned device data is saved in a database and can be opened at any time. The device data can be exported individually or automatically in various formats.

3.10.1 RFID position

The position of the chip on dispensing devices is marked with the lettering RFID.
3.11 Materials

**NOTICE! Aggressive substances may damage components, consumables and accessories.**

- Check the chemical resistance before using organic solvents or aggressive chemicals.
- Only use liquids whose vapors do not attack the materials used.

The assemblies which can be accessed by the user are made of the following materials:

<table>
<thead>
<tr>
<th>Component</th>
<th>Material</th>
</tr>
</thead>
<tbody>
<tr>

3.12 Warranty

In case of warranty claims, contact your local Eppendorf contractual partner.

No warranty is given in the following cases:

- In the case of misuse.
- If unauthorized persons open the upper part.

The following assemblies are excluded from the warranty:

- Wear parts
- Rechargeable battery

3.13 Pipette tips

The pipette tips are available with various degrees of purity, with and without filters, and as special tips.

4 Installation
4.1 Mains/power supply device assembly

**WARNING! Incorrect or damaged mains/power supply devices can cause severe personal injury and damage to the device.**
Incorrect or damaged mains/power supply devices may cause electric shock, overheat the device, set it on fire, melt it, short-circuit it or cause similar damage.

- Only use the mains/power supply device which is included in the delivery to charge the device. You can identify the correct mains/power supply device by the Eppendorf logo and the device name on the mains/power supply device.
- Do not use damaged mains/power supply devices.

### 4.1.1 Identifying the mains/power supply device
The original mains/power supply device from Eppendorf is labeled with the compatible dosing devices, the order number and the Eppendorf logo.

![Pipettes Multipette® Repeater® Easypet® 3 4986 603.005](image)

### 4.1.2 Inserting the power plug adapter
1. Select the appropriate power plug adapters for the mains/power line.
2. Push the power plug adapter on the mains/power supply device until it locks into place.

### 4.1.3 Replace the power plug adapter.
1. Press and hold down the release on the mains/power supply device.
2. Disconnect the power plug adapter.
3. Select the appropriate power plug adapters for the mains/power line.
4.2 Connect the rechargeable battery

WARNING! Personal injury due to incorrect handling of the rechargeable battery.

- Only use rechargeable batteries supplied by Eppendorf.
- Never pierce, crush or throw the rechargeable battery.
- Only use the rechargeable battery in the supplied device.
- Do not touch a leaking rechargeable battery.
- Do not use a damaged rechargeable battery.
- Dispose of rechargeable batteries in accordance with the legal requirements.

The Li-polymer rechargeable battery is already inserted into the battery compartment on delivery.

1. Open the rechargeable battery compartment lid.

2. Connect the connector to the connector socket.
3. Close the rechargeable battery compartment lid.
4.3 Setting the Date and Time – Xplorer plus

Set the Date and Time parameters during the initial setup.

Prerequisites
- The rechargeable battery is connected.
- The rechargeable battery is charged.
- The pipette is switched on.

1. Select Date or Time using the rocker.
2. Press the Select softkey.
3. Change the value using the rocker.
4. Press the Next softkey to change the field.
5. Press the End softkey to end the entry.
6. Change the second parameter in the same way.
7. Press the End softkey to end the entry.
8. Press the rocker down.

   The basic position of the piston is checked. The pipette is ready for use afterwards.

5 Operation

5.1 Charging the rechargeable battery

NOTICE! Loss of full charging capacity of the rechargeable battery if charged incorrectly.
The supplied rechargeable battery is not fully charged. The rechargeable battery will only reach its full capacity after several discharging and charging cycles.
- Do not charge the rechargeable battery in a hot environment (> 60 °C).
- Only charge the rechargeable battery using the supplied mains/power supply device.

NOTICE! Material damage due to outdated rechargeable battery.
If the rechargeable battery exceeds its service life, the rechargeable battery may become deformed or burst.
- Replace the rechargeable battery when the housing is deformed.
- Replace the rechargeable battery if the charging cycles are unusually short.
- Replace the rechargeable battery if it is older than 3 years.

If a rechargeable battery is highly discharged, a minimum charge state is required before the dispenser can be used.

The display shows a message indicating when the rechargeable battery needs to be charged.
5.1.1 Charging the rechargeable battery with the mains/power supply device

Prerequisites
- The rechargeable battery is connected.

1. Insert the mains/power supply device into the socket.
2. Connect the charging plug to the connector socket.
   - The charging process is shown on the display.
   - The rechargeable battery symbol flashes during charging.

5.1.2 Charging the rechargeable battery in the charger stand or in the charger carousel

Fig. 5-1: Charger stand and charger carousel

Prerequisites
- The mains/power supply device is connected.
- A suitable charger shell is inserted.

1. Place the pipette with the charging contacts into the charger shell.
   - The charging process is shown on the display.
5.2 Preserving the battery capacity
The battery capacity can be preserved over the service life to a great extent.

5.2.1 Longer periods without operation – with charger stand
- Store the pipette in the plugged-in charger stand. The state of charge of the battery is automatically monitored and charged.

5.2.2 Longer periods without operation – without charger stand
1. Charge the battery completely if the pipette is not used for a longer period of time (> 4 weeks).
2. Recharge the battery completely every 2 months.

5.2.3 Replacing the rechargeable battery
1. Open the rechargeable battery compartment lid.
2. Loosen the connector of the rechargeable battery from the connector socket.
3. Remove the rechargeable battery.
4. Insert a new rechargeable battery.
5. Connect the connector of the Li-polymer rechargeable battery to the connector socket.
6. Close the rechargeable battery compartment lid.

5.3 Switching the pipette on or off

5.3.1 Switching on
- Keep the On/Off key pressed. The pipette switches itself on.

5.3.2 Switching off
- Keep the On/Off key pressed. The pipette switches itself off.
5.4  Sets the operating mode
   - Set the selection dial to the desired operating mode.

5.5  Setting the parameters (edit mode)

Prerequisites
   - The pipette is switched on.
   - The operating mode has been selected.

Change the parameters as follows:
1. Press the Edit softkey to open the edit mode.
2. Press the Next softkey to go to the next dispensing parameter.
3. Change the dispensing parameter marked in the display using the rocker.
4. Press the End softkey to save the changes, to exit the edit mode and to continue with dispensing.
   - If you want to cancel editing without saving the changes made, briefly turn the selection dial to another mode.
   - You can change the Speed, Time, Cycles and Counter parameters during dispensing.
     - Press the Edit softkey during execution.

5.5.1  Xplorer/Xplorer plus

### Operation

#### Set counter
The counter counts the number of dispensing operations performed. The numerical value of the counter is increased by 1 when the piston reaches the basic position after dispensing. If the piston is in the basic position, you can alternatively set the counter to 0 by turning the selection dial forward or backward. You can switch the counter on and off in the Options.

#### Mixing volume
The mixing volume used after pipetting. If you change the pipetting volume under Set volume, the mixing volume changes accordingly.

#### Mixing cycles
1 to 99 mixing cycles can be set for the mixing volume. The mixing cycles are counted down to 0. If you keep the rocker pressed down during mixing, after 0 has been reached, mixing is continued until the rocker is released. If you press the rocker up during mixing, the mixing process is stopped. The mixing speed matches the selected speed for aspiration and dispensing.

</tbody>
</table>
5.6 Using pipette tips

The liquid to be dispensed is aspirated into pipette tips.

The pipette can only be used if a pipette tip has been attached. You can either attach the pipette tip by hand or directly insert the end of the pipette into a tip held in the tip storage box (e.g., epT.I.P.S. tray).

- The color coding of the pipette matches that of the epT.I.P.S. tray.

- If you attach a pipette tip by hand, it must be handled in a way that prevents both the contamination and heating of the pipette tip.

1. Select the appropriate pipette tip(s).
2. Fit the appropriate pipette tip on the tip cone, applying light pressure. The pipette tip is fitted securely when the tip cone responds with spring-loaded action.

You can deactivate the spring-loaded action of the tip cones.

The tip cones on pipette models larger than 1000 μL do not respond with spring-loaded action.

Do not use filter tips if a filter sleeve with protection filter is inserted.
5.7 Volume limit in the case of pipette tips with a filter

A filter in the pipette tip reduces the volume of the pipette tip. With some ep Dualfilter T.I.P.S filter tips, the volume of liquid aspirated must be limited in all dispensing modes and during reverse pipetting (see Volume limit – setting the volume limit on p. 52).

5.8 Tips for correct pipetting

Observe the following information in all dispensing modes:

5.8.1 Preparing pipetting

Fig. 5-2: Tip-Tub reagent reservoir

- Always place the liquid in a suitable tube. For multi-channel pipettes, we recommend the Tip-Tub reagent reservoir as a liquid reservoir. The liquid and the pipette should have approximately the same temperature.
- Use the pipette tips only once.
- Use epT.I.P.S. LoRetention for solutions containing surfactants is for minimizing residual moisture in the tip after dispensing.
- Use ep Dualfilter T.I.P.S. to prevent aerosol contamination in the tip.
- Check whether the set aspiration and dispensing speeds are suitable for the liquid. The blow-out (Blow) will be conducted at approximately the same speeds.

5.8.2 Aspirating liquid

1. Wet the new pipette tip by aspirating and dispensing the liquid to be pipetted one to three times.
2. Vertically immerse the pipette tip into the liquid approx. 4 mm during aspiration.
3. Press the rocker up to aspirate liquid. Maintain the immersion depth to ensure no air is accidentally aspirated.
4. For large volumes, keep the pipette tips in the liquid for approx. 3 seconds after aspiration.
5. After aspiration, slowly pull the pipette tip out of the liquid.
5.8.3 Dispensing liquid

1. When dispensing liquid, place the pipette tip at a slight angle against the wall of the tube.
2. Press the rocker down to dispense the liquid.
3. After dispensing, wait until no more liquid is dispensed.
4. Press the rocker down again to trigger the blow-out (Blow).
5. Wipe the pipette tip against the tube wall.

Stopping the piston movement
Pressing the rocker in the other direction when the piston is still moving will stop the piston movement. You can then move the piston either up or down by pressing the rocker in the corresponding direction. Pressing the rocker up will abort a mixing process.

Operating modes with the rocker pressed down: in the Man mode, the ongoing piston movement is immediately stopped by releasing the rocker. In the Ads mode, an ongoing dispensing step is completed after the rocker is released. The next dispensing step is only performed when the rocker is pressed accordingly.

• Free jet dispensing may be used to dispense aqueous solutions with a volume of approximately 20 μL or more. We recommend wall dispensing for dispensing aqueous solutions with a smaller volume.
• Select level 8 for the Speed parameter when using use free jet dispensing and if the geometry of the dispensing tube permits this action.
• If you dispense liquid in the free jet, the reverse stroke must also be dispensed in the free jet. If a drop then forms on the pipette tip, it is included in the first dispensing volume.
• For wall dispensing, trigger the reverse stroke with the pipette tips on the tube inner wall.
• During dispensing, do not switch between free jet dispensing and wall dispensing.
The following information applies especially to high viscous solutions:

- During the blow-out (Blow), keep the rocker pressed down if the liquid is flowing out at a slow rate to ensure that the liquid can securely flow out. If you keep the rocker pressed during the blow-out (Blow), the piston in the pipette will remain at its lowest position.
- Wipe any outer wetting against the wall of the tube while holding the rocker pressed down.
- Leave the dispensing vessel with the rocker pressed down. The rocker may only be released outside of the dispensing vessel. The piston will only move to its basic position after the rocker has been released.
- Press the rocker down again to repeat the blow-out (Blow) as necessary.

### 5.9 Automatic dispensing (Ads selection dial setting)

In the *Auto dispensing (Ads)* mode, liquid is aspirated and dispensed in uniform partial volumes in selected time intervals. The reverse stroke and remaining stroke are triggered before or after the dispensing steps.

**Prerequisites**

- The pipette is switched on.
- The *Auto dispensing (Ads)* operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
   Then follow the instructions on the display.
2. Press the rocker down to trigger the reverse stroke.
3. Keep the rocker pressed for the duration of dispensing. After the first dispensing step, the following dispensing steps are triggered with the displayed time interval (*Time*).
After dispensing, decide whether the residual liquid should be dispensed or liquid should be aspirated again.

- **Liquid aspiration**: press the rocker up once.
- **Liquid dispensing**: press the rocker down twice.

### 5.10 Dispensing of liquid – Dis selection dial setting

In the Dispensing (Dis) mode, liquid is aspirated and individually dispensed in uniform partial volumes. The reverse stroke and remaining stroke are triggered before or after the dispensing steps.

1. **Aspiration**
2. **Reverse stroke**
3. **Dispensing**
4. **Aspirate or empty**

**Prerequisites**
- The pipette is switched on.
- The Dispensing (Dis) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
2. Press the rocker down to execute the reverse stroke.
3. Press the rocker down again for each dispensing operation. The display indicates the remaining dispensing steps under Steps.

After dispensing, decide whether the residual liquid should be dispensed or liquid should be aspirated again.

- **Liquid aspiration**: press the rocker up once.
- **Liquid dispensing**: press the rocker down twice.
5.11 Pipetting of liquid – Pip selection dial setting

5.11.1 Standard pipetting

In the Pipetting (Pip) mode, liquid is aspirated and then dispensed again.

- Press the Empty softkey to cancel dispensing. The tip is completely emptied.
- Press the rocker up to stop a current dispensing of a large dispensing volume.

Prerequisites
- The pipette is switched on.
- The Pipetting (Pip) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
2. Press the rocker down to dispense the liquid.
3. Press the rocker down again to dispense the residual liquid.
   This blow-out (Blow) is necessary to completely dispense the liquid.

Hold the rocker pressed down to trigger dispensing and blow-out (Blow) in a step.
If you only hold the rocker pressed down during the blow-out (Blow) after dispensing, the piston remains in the lowest position. The piston will only return to the basic position after the rocker has been released. This presents the following advantages:

- If you pipette liquid that drains slowly, you can allow this liquid to flow out.
- You can immerse the pipette tip in the target liquid to prevent unintentional aspiration.

- You can trigger the blow-out (Blow) any time the piston is in the basic position. Press the rocker down.
- Press the rocker in the opposite direction if you would like to stop aspiration or dispensing while it is in progress. The display shows the volume present in the pipette tip after the respective operation has been stopped. You can then continue with liquid aspiration or dispensing.

Dispense the liquid against the tube inner wall if you are determining the systematic and random errors.

5.11.2 Reverse pipetting (Xplorer)

By using the blow-out, more liquid is aspirated with reverse pipetting than with standard pipetting. During dispensing, the blow-out (Blow) does not belong to the dispensing volume. Reverse pipetting is advantageous for plasma, serum and other liquids with a high protein content. Reverse pipetting is not necessary for pipetting aqueous solutions.

1 Keep the rocker pressed  4 Dispense
2 Aspirate the blow-out  5 Aspirate or empty
3 Aspirate

![Diagram of reverse pipetting process]

1. Keep the rocker pressed
2. Aspirate the blow-out
3. Aspirate
4. Dispense
5. Aspirate or empty
Prerequisites

- The pipette is switched on.
- The Pipetting (Pip) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Keep the rocker pressed down.
2. Immerse the pipette tip in the liquid.
3. Release the rocker to aspirate the blow-out.
4. Press the rocker up to aspirate the dispensing volume.
5. Place the pipette tip on the wall of the target tube.
6. Press the rocker down to dispense the liquid.
7. Remove the pipette tip from the destination tube. Residual liquid remains in the tip.

There are two courses of further action:

**Aspirate the same liquid from the same reservoir tube.**
- Press the rocker up to aspirate the same liquid. The residual liquid in the tip is used for further processing.

**Dispense a different liquid**
1. Press the rocker up to discard the residual liquid in the tip.
2. Press the ejector to eject the pipette tip.
   Use a new pipette tip for the next dispensing operation.

5.12 Pipetting and mixing of liquids – P/M selection dial setting

In the Pipetting+Mix (P/M) mode, liquid is aspirated and then dispensed again. Afterwards, an adjustable number of mixing cycles is automatically triggered. The mixing cycles can be continued as often as required.

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aspiration</td>
<td>Dispensing</td>
<td>Auto mixing</td>
<td>Blow out</td>
</tr>
</tbody>
</table>
Prerequisites
- The pipette is switched on.
- The Pipetting+Mix (P/M) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
2. Press the rocker down to dispense the liquid and start the selected mixing cycle. The mixing cycles shown under Cycles in the main field of the display are reduced by 1 with each cycle.
3. After the mixing process, press the rocker down to trigger the blow-out (Blow). If you keep the rocker pressed during the blow-out, the piston moves to the lowest position and remains there until the rocker is released.

- Press the rocker down to stop aspiration.
- Press the rocker up to stop dispensing or the current mixing cycles.
- Hold the rocker pressed down during the mixing cycles to conduct an unlimited number of mixing cycles. The current mixing cycle will still be completed after the rocker has been released.

5.13 Manual pipetting of liquid – Man selection dial setting
In the Manual Pipetting (Man) mode, the pipette is used like a manual dispenser. The maximum aspiration volume can be limited if required. Aspiration can be stopped or continued, or the direction can be changed, as often as required.

1 Aspiration
2 Dispensing
3 Blow-out

You can set a maximum aspiration volume using the Set max. volume parameter in the Option (Opt) mode. The maximum aspiration volume will be displayed during dispensing (Max).
Prerequisites
• The pipette is switched on.
• The Manual Pipetting (Man) operating mode has been selected.
• The parameters have been set.
• The pipette tip has been attached.

1. To aspirate or dispense liquid, press the rocker up or hold it pressed down. The piston movement stops when the rocker is released.
   The display shows the liquid volume in the pipette tip.

2. If the piston is in the basic position, you can trigger the blow-out (Blow) any time by pressing the rocker down.
   If you keep the rocker pressed during the blow-out (Blow), the piston moves to the lowest position and remains there until the rocker is released.

5.14 Special operating modes (Xplorer plus)

If you have never worked with the Xplorer pipette, we recommend becoming familiar with one of the simple operating modes first, e.g., Pipetting or Dispensing. If you turn the selection dial to the Spc dial setting, the special operating modes will be shown in a selection list in the display.

5.14.1 Multiple aspiration of liquid (Aspirate) – Spc selection dial setting

A specific volume will be aspirated in the Multi-Aspirate mode several times. All of the liquid will be dispensed after the aspiration. The Multi-Aspirate mode is the opposite of the dispensing mode.

Prerequisites
• The pipette is switched on.
• The Multi-Aspirate (Spc) operating mode has been selected.
• The parameters have been set.
• The pipette tip has been attached.
1. For every aspiration, press the rocker up to aspirate liquid. The following message appears on the display after aspiration has been completed: *Piston is in top position! Press rocker down!*

2. Press the rocker down to dispense all of the liquid.

3. Press the rocker down again to trigger the blow-out (*Blow*).

4. If the piston is back in the basic position: press the *Back* softkey to exit the mode.

### 5.14.2 Diluting liquid (Diluting) – Spc selection dial setting

Two different liquids are aspirated in the *Diluting* mode. These liquids are separated by an air bubble. The *Diluting* mode is suitable for diluting samples and reagents using an appropriate dilution solution (diluent). First, the diluent is aspirated, then the air bubble, and finally the sample or reagent.

Because both liquids are aspirated in a single pipette tip, the sample or reagent may be slightly contaminated by the dilution solution.

1. Aspiration of the diluent
2. Air bubble
3. Aspiration of the sample or reagent
4. Dispensing

**Prerequisites**

- The pipette is switched on
- The *Diluting (Spc)* operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

For execution, the parameter sequence is carried out in the reverse order of the editing process. The next volume to be aspirated will be shown on the display with a border around it.
1. Press the rocker up to aspirate the diluent.
2. Press the rocker up to aspirate the air bubble.
3. Press the rocker up to aspirate the sample or reagent.
4. Press the rocker down to dispense all of the liquid.
5. Press the rocker down to trigger the blow-out Blow.
6. If the piston is in the basic position: press the Back softkey to exit the mode.
   - Set a high value for the Dispensing speed parameter to achieve a good mixture for dispensing.
   - To achieve a very high mixture, you can enter the Diluting mode with the Pipetting+Mix mode as the program.
   - When using pipette tips with a large diameter, it is recommended to use low speed levels for liquid aspiration. For a nominal volume of 5 mL and 10 mL, the use of pipette tips with the label L (Long) is recommended.

5.14.2.1 Examples
Required auxiliary equipment:

- Xplorer plus with a nominal volume of 1000 μL
- Dispensing tube (1.5 mL)

Example 1 – total volume 500 μL, dilution 1:10

- Diluent: 450 μL
- Air bubble: 300 μL – 500 μL
- Sample or reagent: 50 μL

Example 2 – total volume 900 μL, dilution 1:10

- Diluent: 810 μL
- Air bubble: 100 μL
- Sample or reagent: 90 μL

Example 3 – total volume 1000 μL, dilution 1:10

- Diluent: 900 μL
- Air bubble: 0 μL
- Sample or reagent: 100 μL
5.14.3 Sequential dispensing of liquid – Spc selection dial setting

Up to 10 different volumes can be dispensed in the Seq. Dispensing mode. The sum of the dispensing volumes may not exceed the pipette tip filling volume. This mode is well suited for dilution series. The Seq. Pipetting mode is also well suited for dilution series. To conduct a dilution series, dispense two different liquids in the opposite direction. This allows you to achieve different dilutions with the same volume per tube.

If the sum of the dispensing volumes exceeds the volume of the pipette tip: create a program and execute the mode several times in a row.

---

1 Sequential dispensing of solution 1  2 Sequential dispensing of solution 2 in the opposite direction

Prerequisites

- The pipette is switched on.
- The Seq. Dispensing (Spc) operating mode has been selected.
- The parameters have been set
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
2. Press the rocker down to execute the reverse stroke.
3. Press the rocker down for each dispensing step.
4. If the piston is in the basic position: press the Back softkey to exit the mode.
5.14.3.1 Example
Required auxiliary equipment:
- Xplorer plus with a nominal volume of 300 μL
- 4 dispensing tubes (200 μL)

<table>

5.14.4 Reverse pipetting of liquid – Spc selection dial setting
The Rev. Pipetting mode is well suited for plasma, serums and other liquids with a high protein content. The Pipetting mode is also well suited for aqueous solutions. The Rev. Pipetting mode is also well suited for solutions containing wetting agents in order to minimize the formation of foam during dispensing in the target tube. The liquid is aspirated using blow-out (Blow). The blow-out is not part of the dispensing volume and may not be dispensed into the target tube. If you use the same liquid again, the blow-out may remain in the tip. If you use a different liquid, discard the blow-out and the pipette tip.

1 Aspiration
2 Dispensing
3 Aspirate or empty

Prerequisites
- The pipette is switched on.
- The Rev. Pipetting (Spc) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.
1. Press the rocker up to aspirate the blow-out and the liquid to be dispensed. The aspiration of the dispensing volume and blow-out will be displayed under the dispensing volume with the label + Blow ▲.

2. Press the rocker down to dispense the liquid. The piston returns to the basic position. Liquid remains in the tip after the dispensing volume has been dispensed.
   - Press the rocker up to aspirate the same liquid.
   - Press the rocker down to end the pipetting and discard the blow-out (Blow).

If necessary, activate the Counter setting in the options to count the executed dispensings using the pedometer.

5.14.5 Sequential pipetting of liquid – Spc selection dial setting

In the Seq. Pipetting mode, a maximum of 10 different pipetting volumes are dispensed in a fixed sequence. This mode is well suited for dilution series. The Seq. Dispensing mode is also well suited for dilution series. The random error (precision) and systematic error (accuracy) are better for pipetting than with dispensing. The Seq. Pipetting mode offers more flexibility with the volume selection than the Seq. Dispensing mode.

Prerequisites
- The pipette is switched on.
- The Seq. Pipetting (Spc) operating mode has been selected.
- The parameters have been set.
- The pipette tip has been attached.

1. Press the rocker up to aspirate liquid.
2. Press the rocker down to dispense the liquid.
3. Press the rocker downward after the dispensing to execute the blow-out (Blow).
4. If the piston is in the basic position: press the Back softkey to exit the mode.
5.15 Executing the saved program – Prg selection dial setting (Xplorer plus)

Previously stored programs can be executed in the Program (Prg) operating mode. Programs consist of 1-4 combined operating modes in a defined sequence. Up to 10 different programs can be created.

Prerequisites
- The pipette is switched on.
- The Program (Prg) operating mode has been selected.
- The program has been created.
- The pipette tip has been attached.

1. Select the program using the rocker.
2. Press the Select softkey.
   The execution of the program depends on the operating modes used.

- The blow-out (Blow) must always be executed in the “Pipetting” mode.

5.16 Editing the program – Edit selection dial setting (Xplorer plus)

Programs and pipettings with fixed volumes can be created and edited in the Edit mode. Stored programs can be executed in the Program (Prg) mode. Stored programs with fixed volumes can be stored in the Fixed volumes (Fix) mode. If necessary, programs and pipettings with fixed volumes can be password protected using the Pswrd. protection option.

Prerequisites
- The pipette is switched on.
- The Edit operating mode has been selected.

1. Select the desired list entry using the rocker.
2. Press the Select softkey.
   The next steps are described in the following subchapters.

5.16.1 Pswrd. protection

You can protect the Edit mode and in the Opt mode the Adjustment option using a four-digit, numerical password. This prevents stored programs and pipettings from being changed. The passwords for the Edit mode and the Adjustment option in the Opt mode may vary. The password can be changed or deactivated after it has been entered. If you lose your password, please contact your local Eppendorf distribution partner to obtain a temporary password (Master key). Keep the pipette at hand when you make the call.
If you lose the password for the Edit mode, you will not be able to change any programs or pipettings with fixed volume.

1. Turn the selection dial to Edit.

You can also activate a password protection under the selection dial setting Opt after selecting the Adjustment option.

2. Select the Psrd. protection option using the rocker. ON appears in the display.

3. Press the Select softkey.

4. Use the rocker to select the digit.

5. Press the Select softkey.

6. Press the Next softkey to switch to the next field.

7. Enter data in all of the fields.

8. Press the Save softkey to save the password.

Re-enter the password to deactivate the password protection.

5.16.2 Creating or changing Fixed volume

Creating a new pipetting

1. Select the New fixed volume entry using the rocker.

The parameters of the most recently used pipetting will be displayed when the New fixed volume entry is opened. Up to 10 fixed volumes can be saved.

2. Press the Edit softkey.

3. Change the parameters as you did in the Pipetting mode.

4. Press the Save softkey.

The saved pipetting now appears in the Fixed volumes (Fix) operating mode with dispensing volume, aspiration speed and dispensing speed.

Changing saved pipettings

1. Select the pipetting using the rocker.

2. Press the Select softkey.

3. Select the Edit option.

4. Press the Select softkey.
5.16.3 Creating or changing Program

Creating a new program
1. Select the New program entry using the rocker. Up to 10 programs can be saved.
   You will be prompted to name the program. You can enter a name with a maximum of six characters.
   The program name cannot be changed later. Copy the program to change the name. You will be prompted to enter a new name. Then delete the original program.
2. Select the characters using the rocker.
3. Press the Next softkey to switch to the next field.
4. Press the Save softkey to save the name.
5. Select the first operating mode. All operating modes except Manual Pipetting are available.
7. Change the parameters of the mode as usual.
8. Press the Save softkey.
   A list with all of the previously saved program modes appears.
   - Press the Next softkey to add another mode. A program can contain up to 4 modes.
   - Press the Save softkey to save the program. The saved program now appears in the Program (Prg) operating mode.

Changing the saved program

Prerequisites
To change the mode of a program, the program needs to be saved first.
1. Select a saved program from the list.
2. Press the Select softkey.
   Select the Copy option to create a program based on another program. You must then enter a name for the copied program. If you only want to change the name of a program, select the Copy option.
3. Select the Edit option.
4. Press the Select softkey.
   - Select the Edit mode option to change a program mode.
   - Select the Insert mode option to add a mode to the program.
   - Select the Delete mode option to delete a program mode.
5.17 Pipetting with fixed volume – Fix selection dial setting (Xplorer plus)

Previously stored programs with fixed volumes can be executed in the *Fixed volumes* (Fix) mode. Up to 10 different pipettings can be created. 3 fixed volumes are predefined upon delivery:
- 10% of the nominal volume
- 50% of the nominal volume
- 100% of the nominal volume

The aspiration speed ▲ and dispensing speed ▼ are displayed to the right of the fixed volume.

Prerequisites
- The pipette is switched on.
- The *Fixed volumes* (Fix) operating mode has been selected.
- Pipetting with fixed volume has been created.
- The pipette tip has been attached.

1. Select the pipetting using the rocker.
2. Press the *Select* softkey.
3. Press the rocker up to aspirate liquid.
4. Press the rocker down to dispense the liquid.
5. Press the rocker downward after the dispensing to execute the blow-out *(Blow)*.

5.18 Option – Opt selection dial setting

You can set the following options, which apply to all operating modes in the *Option* mode.

Options:
- *General help*
- *Volume limit*
- *Counter*
- *Ejector reset*
- *Rocker setting*
- *History*
- *Sound level*
- *Brightness*
- *Adjustment*
- *Language*
- *Personalization*
- *Service*
- *Service interval*
- *Date/Time*
Prerequisites
• The pipette is switched on.
• The Option operating mode has been selected.

1. Select the list entry using the rocker.
2. Press the Select softkey to open the list entry.
3. Change the list entry using the rocker.
4. Press the End or Back softkey to exit the list entry.
5. Turn the selection dial to a different operating mode to exit the Option function and to continue with dispensing operations.

5. Press the Help softkey to display information on the selected option.

5.18.1 General help – calling a description of the modes
This describes the elementary steps for all modes. This option does not contain any adjustable parameters.

5.18.2 Volume limit – setting the volume limit
This limits the aspiration volume in all dispensing modes.

After a volume limit has been set, a note will be shown on the display when the Pip, P/M and Man operating modes are edited and when the volume limit has been reached. In this mode, too large dispensing volumes will be automatically reduced to the defined volume limit. The number of potential dispensing steps will be automatically limited in the Dis and Ads modes.

If the corresponding volume is above the defined volume limit, saved dispensings can no longer be executed under History and under the Spc, Prg and Fix modes. The volume can be changed in the corresponding mode or the Edit mode.

After a volume limit has been set, not all options can be used in the Spc mode.

Use the volume limit in the following cases:
• For strongly foaming solutions in order to prevent contamination of the tip cone or the protection filter.
• For pipette tips or filter tips whose aspiration volume is smaller than the nominal volume of the pipette.
• When using ep Dualfilter T.I.P.S. in the Ads, Dis and Pip (reverse pipetting) modes and the Xplorer plus Rev. Pipetting mode. For these three versions, there is a risk of the liquid coming into contact with the dualfilter because of the additional volumes during aspiration.
Other volume limits may apply when using filter tips from other manufacturers. The volume limit differs depending on the tip geometry and the position of the filter in the tip.

The volume limit is dependent on the additional aspirated volumes of the pipette. On the Xplorer the individual nominal volumes result in different additional volumes.

<table>

</tr>
</tbody>
</table>

* When using these filter tips, we recommend that you use the adjustment epTIPS long in order to increase the accuracy of dispensing. The volume limit stated applies only to the changed adjustment.

** We recommend this volume limit even when performing reverse pipetting and using the 5 mL and 10 mL epT.I.P.S. without a filter.

5.18.3 Counter – switching the counter for dispensing steps on/off
The counter provides information on the dispensing operations performed in the Pip mode. You can switch the counter on and off using the rocker. After you select the Pip mode, an activated counter shows 0. The value can be changed in the Pip mode.

5.18.4 Ejector reset labware
The Ejector reset option has two settings:
• ON (default setting) – the piston automatically moves to the basic position even when a filled pipette tip is ejected.
• OFF – the piston does not automatically move to the basic position.

⚠️ CAUTION! Unintended dispensing when the Ejector reset option is activated.
- When working with a removed ejector sleeve, set the Ejector reset option to OFF to prevent unintentional dispensing from the pipette tip in case the ejector is accidentally pressed.

5.18.5 Rocker setting – setting the speed of the rocker
The change speed of the volume in the editing mode can be adjusted to suit your needs. 8 levels are available (1 = slow, 8 = very fast). Level 5 is set upon delivery.

5.18.6 History – saving and displaying dispensing settings
If you activate the History option, the History softkey will be activated instead of the Help softkey for most of the operating modes. The last 10 dispensing settings of the active mode can be accessed using the History softkey. The dispensing steps appear in chronological order. Dispensing settings will only be stored if the History option is activated.

5.18.7 Setting the Sound level
You can change the sound volume of the acoustic signals. At 0 volume, the sound is switched off and the symbol will not be displayed.

5.18.8 Setting the Brightness (display)
The display brightness can be adjusted to suit your needs.

5.18.9 Setting the Adjustment
The piston stroke of the Xplorer pipettes can be changed in the Adjustment option by the user. You can select another adjustment instead of the "Factory setting". Instructions on performing the adjustment can be found in the document adjustment on our webpage www.eppendorf.com/manuals.
Making an adjustment sets the dispensing volume in such a way that systematic error is minimized for the intended application. Carry out a gravimetric test of the adjustment.

Every pipette whose adjustment has been changed must be marked with a clearly visible label that indicates the type of change made. This ensures that other users will be informed of the changes to the adjustment, in addition to the information provided in the header of the display.

You can overwrite a selected adjustment by selecting another adjustment. The applicable symbols for the new adjustment will be shown in the display header.

For the Xplorer plus, the adjustment can be protected with a password.

If another adjustment has been selected instead of the factory setting, the symbol and at least one additional symbol appear in the display header. Before changing an adjustment, make sure to read the chapter "Display" and the document "Adjustment" www.eppendorf.com/manuals.

The following adjustments can be selected:

- **Factory settings**
  Resets the adjustment to the factory setting. The factory settings cannot be changed.

- **Liquid type: Ethanol 75%**
  The factory setting is changed by a factor in order to allow 75% ethanol to be dispensed with higher accuracy. The internally used factor takes into account the density and the following work technique in the **Pip** mode:
  1. Wet the tip with liquid three times at room temperature. Hold the pipette vertically during this time. Avoid outer wetting during dispensing.
  2. Use speed level 5 for aspiration and dispensing.
  3. Dispense liquid against the tube wall of the destination tube.
  4. Trigger a blow-out (Blow) approx. 2 seconds after dispensing. Then eject the pipette tip.

- **Liquid type: Glycerol 50%**
  The factory setting is changed by a factor in order to allow 50% glycerol to be dispensed with higher accuracy. The internally used factor takes into account the density of the 50% glycerol and the same work technique as described previously for Ethanol 75% in the **Pip** mode.

- **epTIPS long**
  In addition to the "standard tips", a second longer tip is available for most pipettes. When **epTIPS long** is selected, the tip geometry of this longer tip is taken into account in the internal volume calculation. This reduces the systematic error of dispensing when using these tips.
The epT.I.P.S. specified here are also available as ep Dualfilter T.I.P.S.

- **Altitude**
  The aspiration volume of a piston-stroke pipette is reduced at increased altitudes, which entail a fall in air pressure. The average air pressure at the corresponding height is used to correct the stroke. The altitude can be selected in 250 m (820 ft) increments. The maximum selectable height is 5000 m.
  The pipette is set to an altitude of 0 m upon delivery. This is the factory setting.

  The liquid type (*Ethanol 75%* or *Glycerol 50%*), epTIPS long and Altitude options can be combined.

For the following adjustments, you must know the exact density of the solution to be dispensed. The recording of the weighing results requires the use of a fine balance with a high resolution. Dispensing volumes below 10 μL require a balance with a resolution of 0.001 mg. An existing 1-3 point adjustment can be changed.

- **1-point adjust.**
  After you input the density, the selected volume and the corresponding weighing result, the pipette will determine a correction factor. The factor is only correct for the selected volume and the selected work technique. However, the factor is used for the entire volume range of the pipette. You must carry out a gravimetric test to check the validity of the factor.

<table>
<thead>

<td>turquoise</td>
<td>turquoise</td>
</tr>
</tbody>
</table>
• **2-point adjust.**
  After you input the density, two different volumes and the corresponding weighing result, the pipette will determine a correction factor. The factor is only correct for the selected volume range and the selected work technique. However, the factor is used for the entire volume range of the pipette, i.e., below and above the two measuring points as well. You must carry out a gravimetric test to check the validity of the factor.

• **3-point adjust.**
  After you input the density, three different volumes and the corresponding weighing results, the pipette will determine two correction factors. The factors are correct from measuring point to measuring point in the selected volume regions and for the selected work technique. The respective factor is, however, also used below and above the first or third measuring point. You must carry out a gravimetric test to check the validity of the factors.

  If an adjustment other than factory settings is applied, a gravimetric test of the pipette must be carried out first. This is the only way to ensure that the selected adjustment meets requirements regarding errors.

5.18.9.1 Activating the *Pswwrd.* protection (Xplorer plus)
You can protect the adjustment using a four-digit, numerical password. The password for the *Edit* mode and the *Adjustment* option can vary. The password can be changed or deactivated after it has been entered. If you lose your password, please contact your local Eppendorf distribution partner or reset the pipette to the factory settings.

  The adjustment can no longer be changed if the password has been lost.

1. Press the rocker upward to activate the password protection. 
   *ON* appears in the display.
2. Press the *Select* softkey.
3. Use the rocker to select the digit.
4. Press the *Next* softkey to switch to the next field.
5. Enter data in all of the fields.
6. Press the *Save* softkey to save the password.
7. Reenter the password after completing the saving procedure.
8. Press the *Enter* softkey.
Password protection is active.
5.18.10 Language – setting the language

Mark a language in the selection list using the rocker. The selected language is only activated after the completion of the language selection.

When selecting a language, the softkeys and the language selection list are always in English. This makes it easier to return to the desired language if you select an unknown language by mistake.

5.18.11 Personalization – personalizing the pipette

You can use the rocker to select letters and numbers to personalize the pipette. The selected personalization will be displayed after the pipette has been activated from sleep mode or after the reset. When the pipette is delivered, it is personalized as My Xplorer.

5.18.12 Service – calling up service functions

The options listed here are not needed during normal routine use.

A selection list offers the following service options:

- **Software version**: Displays the current software version.
- **Parameter ver.**: Displays the applicable data record for this pipette. The data record is different for the various volumes.
- **Initial reset**: After a security query, the pipette will be reset to factory settings and all entries will be reset to the "default values". This type of reset may be useful when transferring the pipette to another workstation.
- **Check procedure**: For service personnel only.
- **Software update**: For service personnel only.
- **USB**: For service personnel only.

5.18.13 Activating the Service interval (Xplorer plus)

If the Service interval option is activated, the pipette will remind you about the required maintenance or repeating the gravimetric test. You can set the reminder for a specific time or after a specific number of cycles.

The display shows the following options after Time interval or Cycles interval has been selected:

- **Last service**
- **Next service**
- **Set interval**
- **Reset**
For the *Set interval* parameter, set the required interval. If you do not want to use the *Service interval* option, set the value of the parameter to 0. Triggering the reset function resets the interval. If the pipette should start counting at a specific initial value, enter the value under *Set interval* and then select *Reset*. You can view the last time a reset was triggered for the executed maintenance under *Last service*. You can view when the next maintenance needs to be executed under *Next service*. If the interval has elapsed up to 90%, the pipette shows the next required maintenance in the display. Monitoring of the interval time and the interval cycles function independently of each other. If you activate the interval time and interval cycles, you will receive a maintenance reminder for both settings. A reset may be required after the maintenance and the gravimetric test.

### 5.18.14 Setting the *Date* and *Time* (Xplorer plus)

**Prerequisites**
- The pipette is switched on.
- The *Opt* operating mode has been selected.
- The pipette is switched on.
- Select *Date* or *Time* using the rocker.
- Press the *Select* softkey.
- Change the value using the rocker.
- Press the *Next* softkey to change the field.
- Press the *End* softkey to end the entry.
- Change the second parameter in the same way.
- Press the *End* softkey to end the entry.

### 5.19 Resetting the pipette to the factory setting

All settings (language, selected parameters, options, etc.) of the pipette are reset to their initial state. All the saved program and adjustment settings are deleted.

The *Initial reset* function also overwrites existing password protection.

#### 5.19.1 Performing *Initial reset* – Opt selection dial setting

**Prerequisites**
- The pipette is switched on.
- The *Option* operating mode has been selected.

1. Select *Service* from the list.
2. Select *Initial reset* from the list.
3. Confirm the confirmation prompt.
   - The pipette is reset to its initial state.
6 Troubleshooting

6.1 Reset

The pipette will be reset to the initial state during the reset. The settings you have saved are retained.

Press the Reset key using a pipette tip or another pointed object. The personalization and software version will be shown in the display during the reset.

You will be prompted to press the rocker down in the display. Make sure that any liquid in the pipette tip is dispensed correctly. Then, you need to confirm the Date and Time.

6.2 Error search

6.2.1 Rechargeable battery

### 6.2.3 Liquid

<table>
<thead>
<tr>
<th>Symptom/message</th>
<th>Possible cause</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Liquid is dripping from the tip and/or the dispensed volume is incorrect. | • The pipette tip is loose or does not fit correctly.  
  • Liquid with high vapor pressure and/or different density.  
  • Pipetting was too quick.  
  • The tip was withdrawn from the liquid too early or too quickly.  
  • Liquid dispensed without blow-out (Blow) in Pip mode. | • Attach the tip firmly.  
  • Use epT.I.P.S.  
  • Wet the tip multiple times.  
  • Adjust the pipette for the liquid used.  
  • Set a lower speed.  
  • Withdraw the tip from the liquid slowly and with a time delay (of about 3 seconds for large volumes) after aspiration.  
  • Trigger blow-out (Blow) after dispensing has been completed during standard pipetting applications. |
|                   | • The piston is contaminated.  
  • The piston is damaged.  
  • The tip cone is damaged.  
  • The O-rings of the tip cones are damaged. | • Clean and lightly lubricate the piston.  
  • Replace the piston.  
  • Replace the lower part or channel.  
  • Replace the O-rings (only 100 μL, 300 μL, 1200 μL multi-channel). |
| Liquid flows unevenly into or out of the tip. | • The piston is contaminated.  
  • The tip is damaged  
  • The seal is dirty.  
  • The pipette is blocked. | • Clean and lightly lubricate the piston.  
  • Use a new tip.  
  • Clean the lower part.  
  • Replace the protection filter (for 2.5 mL, 5 mL and 10 mL). |
| The following message appears briefly before the aspiration: **Selected volume not possible with stored adjustment!** | • A factor that was determined during adjustment leads to a very high stroke increase.  
  This high stroke increase limits the dispensing volume. | • Confirm the error message with the OK softkey.  
  The situation can only be remedied by changing the adjustment.  
  • Make sure that you are authorized to carry out the adjustment. |

To prevent dispensing errors, regularly check the precision and accuracy of the pipette. If the pipette is used at an extremely high altitude, it must be adjusted to the respective atmospheric pressure.

Exported as Markdown:

To prevent dispensing errors, regularly check the precision and accuracy of the pipette. If the pipette is used at an extremely high altitude, it must be adjusted to the respective atmospheric pressure.

The gravimetric test and the conversion of the measured values for the volume are described in the document "Standard operating procedure for manual dispensing systems". The document is available on the webpage www.eppendorf.com/manuals.
7 Maintenance

- All single and multi-channel lower parts are wear parts. Clean them after contamination, use of aggressive chemicals and/or heavy stress. If the lower parts are worn or damaged, replace these parts.
- Faulty dispensing results are sometimes due to lack of maintenance.

7.1 Cleaning

7.1.1 Cleaning and disinfecting the housing

**NOTICE!** Damage to device from unsuitable cleaning fluids or sharp or pointed objects.

Unsuitable cleaning agents may damage the device.

- Do not use corrosive cleaning agents, strong solvents or abrasive polishes.
- Check the compatibility with the materials used.
- Please note the information on chemical resistance.
- Do not clean the device with acetone or organic solvents with a similar effect.
- Do not use sharp or pointed objects to clean the device.

**NOTICE!** Damage to device due to penetration of liquid.

- Only immerse the pipette tip in the liquid.
- Do not put the pipette down when the pipette tip is filled.
- The pipette itself may not come into contact with the liquid.

Observe the chemical resistance of the materials.

1. Moisten a cloth with a cleaning agent, a decontamination agent or isopropyl (70 %).
2. Remove any contamination on the outside.
3. Moisten the cloth with water.
4. Wipe down the housing and remove residual cleaning agent.
7.2 Cleaning

**NOTICE! Damage to device from unsuitable cleaning fluids or sharp or pointed objects.**
Unsuitable cleaning agents may damage the device.
- Do not use corrosive cleaning agents, strong solvents or abrasive polishes.
- Check the compatibility with the materials used.
- Please note the information on chemical resistance.
- Do not clean the device with acetone or organic solvents with a similar effect.
- Do not use sharp or pointed objects to clean the device.

**NOTICE! Damage to device due to penetration of liquid.**
- Only immerse the pipette tip in the liquid.
- Do not put the pipette down when the pipette tip is filled.
- The pipette itself may not come into contact with the liquid.

### 7.2.1 Cleaning and disinfecting the pipette

All single and multi-channel lower parts are wear parts. Clean them after contamination, use of aggressive chemicals and/or heavy stress. If the lower parts are worn or damaged, replace these parts.

1. Moisten a cloth with a cleaning agent and a decontamination agent.
2. Remove external contamination.
3. Moisten a new cloth with water.
4. Wipe down the housing.

### 7.2.2 Cleaning and disinfecting the lower part

**Prerequisites**
- Heavy contamination caused by ingress of liquid must be removed.
- Lower part has been removed and disassembled.

1. Remove piston grease.
2. Rinse the lower part with cleaning agent or decontamination agent or let it soak.
   - Observe the contact time recommended by the manufacturer.
3. Thoroughly rinse the lower part with demineralized water.
4. Let it dry.
5. Lubricate the piston or cylinder.
   - See instructions for use "Grease for pipettes".
6. Assemble the lower part.
7.2.3 Sterilizing the pipette with UV light
The pipette can be sterilized with UV light at 254 nm.

7.3 Sterilizing or disinfecting the pipette

NOTICE! Damage to device due to incorrect handling.
- Only autoclave the lower part of the Xplorer pipette.
- Do not use any additional disinfectants, decontamination agents or sodium hypochlorite when autoclaving the lower part.
- When autoclaving the lower part, make sure that the temperature does not exceed 121°C.
- Before using disinfectants or decontamination agents, check their suitability and the manufacturer information regarding chemical resistance. Also take into account the materials of the pipette.

7.3.1 Autoclaving
All lower parts are steam autoclavable.

7.3.1.1 Before autoclaving
1. Remove any contamination from the inside and outside of the lower part.
2. If you remove existing grease, slightly re-lubricate the piston seal using only the grease specified in the ordering information (see the instructions for use on our webpage www.eppendorf.com/manuals).

7.3.1.2 Execution
Follow the operating manual of the autoclave manufacturer.
1. Autoclave at 121°C, 20 minutes, 1 bar pressure.
2. Put the lower part into the autoclave in such a way to ensure that the temperature at the lower part does not exceed 121°C.
3. For 2.5 mL, 5 mL and 10 mL pipettes: Remove the old protection filter. Include the filter sleeve and protection filter (only autoclave the protection filter once).
4. You can put the lower part into the autoclave as a whole unit or as individual parts.
5. Make sure that no parts of disassembled lower parts are confused during subsequent assembly (recommendation: use a plastic beaker for each lower part).
7.3.1.3 After autoclaving
1. Cool the lower part down to room temperature and leave to dry. The piston does not need to be greased following autoclaving.
2. For 2.5 mL, 5 mL and 10 mL pipettes: Insert the protection filter in the filter sleeve. Insert the filter sleeve in the tip cone.
3. Carry out a gravimetric test to check that the Xplorer pipette is functioning.

7.3.2 Disinfection
1. Carefully wipe off the outer surfaces with disinfectant, DNA/RNA decontamination agents or 70 % isopropanol.
2. You can wipe the outside of the tip cone and the ejector sleeve using a sodium hypochlorite solution of 4 %.
3. After the exposure time of the sodium hypochlorite solution has elapsed, thoroughly remove it using demineralized water.

7.4 Replacing O-rings – multi-channel lower part
Replace worn or damaged O-rings on multi-channel lower parts.
Applies to multi-channel lower parts:
- 100 μL
- 300 μL
- 1200 μL

7.4.1 Removing the O-ring
Prerequisites
- O-ring tool (included in the delivery package)

1. Push the opening of the O-ring tool against the tip cone.
2. Supporting the O-ring tool with your thumb, push it against the tip cone. The O-ring is cut at one location.
3. Remove the O-ring tool and O-ring.
7.4.2 Mounting a new O-ring – 100 μL and 300 μL

Prerequisites
- Mounting aid (shortened pipette tip)
1. Fit the installation aid on the tip cone.
2. Push the O-ring over the installation aid and onto the tip cone.
The O-ring must be positioned in the groove in the tip cone.
3. Remove the installation aid
4. Attach the pipette tip and check it is seated correctly.
The pipette tip must be firmly seated on the tip cone.

7.4.3 Mounting a new O-ring – 1200 μL
1. Push the O-ring onto the tip cone.
The O-ring must be positioned in the groove in the tip cone.
2. Attach the pipette tip and check it is seated correctly.
The pipette tip must be firmly seated on the tip cone.

7.5 Xplorer disassembly and assembly

For assembly, the serial number of the upper part and lower part must be identical.

7.5.1 Single-channel ≤ 1000 μL
7.5.1.1 Removing the lower part

1. Keep the ejector pressed and remove the ejector sleeve ①.
2. ② and ③: On the lower part, slide the ring marked “PUSH UP TO RELEASE” up by about 5 mm until the lower part comes off.
3. ④: Remove the lower part from the upper part.
7.5.1.2 Deactivating the spring-loading action of single-channel pipettes

You can deactivate the springs of the tip cones if you want to use pipette tips which require a higher attachment force. The spring-loading action of the tip cone can be deactivated by installing the locking ring. The locking ring is included in the delivery package.

1. Push the black locking ring onto the lower part from the top by slightly squeezing the clamps on the lower part.
2. Insert the lower part into the upper part until it audibly engages.
3. Keep the ejector pressed. The ejector rod protrudes from the upper part.
4. Fit the ejector sleeve onto the ejector rod. If correctly fitted, it will engage slightly.

Remove the locking ring to reactivate the spring-loading action.

7.5.1.3 Deactivating the spring-loading action of multi-channel pipettes

The spring-loading action of the tip cones can be deactivated in the 10 μL, 100 μL and 300 μL multi-channel lower parts by installing 2 – 3 locking clips. The locking clips are part of the delivery package.

Prerequisites
- The multi-channel lower part is open and has been removed from the upper part.
- The channels have been removed.

1. Remove the spring from the channels.
2. Insert the channels without springs.
3. Firmly press the locking clips onto the channels.
4. Assemble the pipette.
### 7.5.1.4 Opening and assembling the lower part (≤ 1000 μL)

#### Prerequisites

The piston is in the basic position.

> To avoid confusing the parts, only disassemble and assemble one pipette at a time.

#### Opening the lower part

1. Slightly push the stop pins together on the piston mount (1).
2. Remove the piston mount.
3. Remove the piston (2) and the piston spring (3). The piston is under spring tension.

The appearance of pistons and piston springs varies according to the individual volume versions.

#### Assembling the lower part

1. Carefully guide the piston and the piston spring into the cylinder. Make sure that the piston is guided correctly in the piston spring and the cylinder. There must not be any perceptible resistance. **Stop pushing as soon as any resistance is felt** This may indicate that the piston is not positioned correctly in the cylinder. There is a risk of bending the piston if too much force is applied. Carefully pull out the piston and repeat the process correctly. In the case of piston springs with double windings (4), these windings must point downwards.
2. Keep the piston and the piston spring pressed.
3. Keep the stop pins on the piston mount pressed with the other hand.
4. Mount the piston mount so that the two stop pins engage in their retainers.
5. Gently press a pipette tip against the inserted piston. The piston must move down in the cylinder without any noticeable resistance.
Installing the lower part and ejector sleeve

1. Insert the lower part into the upper part until it audibly engages.
2. Set the maximum volume and move the rocker up and down several times. There should not be any unusual running noises.
3. Keep the ejector pressed. The ejector rod protrudes from the upper part.
4. Fit the ejector sleeve onto the ejector rod. If correctly fitted, it will engage slightly.
5. Carry out a gravimetric test of the systematic and random errors. This test ensures that no parts were confused during assembly and that the pipette has been assembled correctly.

7.5.2 Single-channel lower parts ≥ 2.5 mL

The piston must be in its basic position before separating the lower and upper part. Press the rocker down to move the piston to its basic position.

1. Unscrew the ejector sleeve.
2. Keep the ejector pressed and turn the lower part approximately 30° to the left or right. Pull the lower part down to cancel the magnetic coupling of the lower part. The lower part is separated from the upper part.
3. Open the lower part: fit the pipette wrench (included in the delivery package) onto the lower part. Hold the cylinder and unscrew it from the lower part. The cylinder with the tip cone is separated from the upper part of the lower part. The upper part of the lower part and the piston cannot be disassembled any further. See the next figure.
The lower part consists of the following:

1. **Cylinder and tip cone**
2. **Piston (with seal)**
   - Piston with magnet
3. **Upper part of the lower part**

Assembly is performed in reverse order. Make sure that the magnet on the piston in the lower part is coupled with the magnet on the spindle in the upper part. After the assembly:

- Carry out a gravimetric test of the systematic and random errors. This test ensures that no parts were confused during assembly and that the pipette has been assembled correctly.

For replacing an ejector sleeve, the 5 mL and 10 mL sizes are delivered with an ejector sleeve and ejector carrier. The lower part must be removed in order to install a new ejector carrier.

### 7.5.3 Multi-channel
#### 7.5.3.1 Loosening and opening the 10 μL, 100 μL and 300 μL multi-channel lower parts

1. ① and ②: Slide the lever on the lower part to the left or right. Pull the lower part down to cancel the magnetic coupling of the lower part to the upper part. This separates the lower part from the upper part so that it can be removed.
2. Put down the lower part with the lever facing downward.
3. ③: Slide the two latches (right and left at the side) down using a coin. The lower part is still lying on the table with the lever facing downward.
4. Remove the cover plate facing upward and the integrated ejector rail.

Do **not** remove the ejector rail from the cover panel. The spring for the ejector rail may accidentally come off and get lost during this step.
7.5.3.2 Removing and installing channels

Channels may only be removed and installed if the multi-channel lower part is separated from the upper part! The channels in the lower parts consist of a piston, cylinder and spring. The channels for 100 μL and 300 μL are equipped with an O-ring at the tip cone.

1. ① and ②: Position a pipette tip under the piston and carefully remove the piston from the upper rail.
2. Carefully pull the piston out in an upward direction. **Do not bend the piston.**
3. Hold the tip cone at the lower end and push it upwards slightly ③ to compress the spring.
4. ④: Lightly lift the tip cone and release it from the lower rail.
5. ⑤: Relax the spring by letting the tip cone slide back above the lower rail.
6. Remove the tip cone, along with the cylinder and spring, from the upper rail. Before installation, slide the piston into the cylinder. Install the channels in reverse order.

7.5.3.3 Assembling the 10 – 300 μL multi-channel lower part

1. Fit the cover plate with the integrated ejector.
2. Push the latches upward.
3. For mounting, push the lower part into the upper part until it audibly engages. Make sure that the magnet on the piston actuator in the lower part is coupled with the magnet on the spindle in the upper part.
4. Carry out a gravimetric test of the systematic and random errors. This test ensures that no parts were confused during assembly and that the pipette has been assembled correctly.
7.5.3.4 Loosening and opening the 1200 μL multi-channel lower part

The method of loosening the 1200 μL lower part matches that of loosening the ≥ 2.5 mL lower parts.

1. Press the rocker down.
   The piston returns to the basic position.
   The lower part can be detached.

2. With the ejector pressed down, turn the lower part approximately 30° and pull down to cancel the magnetic coupling. This releases the lower part from the upper part.

3. View the detached lower part from above. For this, slide the housing case down. Note the exact position of the red marked parts. **The red marked stops on the housing case and the red marked teeth on the inner part are adjacent.** If the stops and teeth are on top of each other after assembly, the housing case has been attached incorrectly.

7.5.3.5 Removing and installing 1200 μL channels
Only disassemble the channels when the upper part is detached from the lower part.

1. Press the unlocking tool as far as it will go into the base plate. The base plate can now be detached by pulling gently at the side - at the side with the unlocking tool inserted. This loosens the base plate on the other side. Remove the base plate.

2. Take the inner part out of the housing case.

3. Loosen the fixing strip from the inner part. To do this, push the fixing strip away from the inner part in the area near the three fixing strip catches on the inner part.

4. Have a close look at the channel arrangement in the inner part. Four channels are accessible from each side. The tip cone of the channels is eccentric to the cylinder. The channels on the opposite side are therefore positioned "mirror-inverted". Ensure that the channels are inserted so that they are aligned in the center again during subsequent assembly.

5. Completely press down the guiding rail for the piston rods. Press the piston rod lightly out of the guiding rail and remove the channels.

6. Before installation, slide the piston into the cylinder. Install the channels in reverse order in accordance with the previously mentioned instructions. After installing the channels, carefully push the guiding rail with the piston rods upwards to ensure that the magnetic coupling of the lower and upper part can be safely reestablished.

7. Insert the reassembled lower part into the upper part. The lower part automatically snaps into the upper part on insertion. Make sure that the magnet on the piston actuator in the lower part is coupled with the magnet on the spindle in the upper part.

8. Carry out a gravimetric test of the systematic and random errors. This test ensures that no parts were confused during assembly and that the pipette has been assembled correctly.
7.6  **Lubricating the piston or cylinder**

The piston or the cylinder in the lower part of the pipette must be relubricated after cleaning or after decontamination.

> The special grease can be ordered as an accessory. The ordering information can be found on our webpage [www.eppendorf.com/manuals](http://www.eppendorf.com/manuals)

---

1. Place a small amount of grease on the cotton swab.
2. Apply a thin film of grease to the running surface of the piston.

The lower part can now be reassembled.

---

1. Place a small amount of grease on the cotton swab.
2. Apply a thin film of grease to the inner wall of the piston.

The lower part can now be reassembled.

---

**7.6.1 Lubricating the piston**

**Prerequisites**
- For volumes $\leq 20 \, \mu$L.
- Lower part is disassembled.

1. Place a small amount of grease on the cotton swab.
2. Apply a thin film of grease to the running surface of the piston.
   - The lower part can now be reassembled.

**7.6.2 Lubricating the cylinder**

**Prerequisites**
- For volumes $> 20 \, \mu$L.
- Lower part is disassembled.

1. Place a small amount of grease on the cotton swab.
2. Apply a thin film of grease to the inner wall of the piston.
   - The lower part can now be reassembled.
7.7 Maintenance

We recommend that you have all maintenance and servicing carried out by Eppendorf AG or Eppendorf service partners. No warranty is provided for any damage due to misuse or if the device has been opened by unauthorized persons.

8.4 Dispensing speeds

The following tables show the minimum duration required for the aspiration of the nominal volume at different speed levels. The actual duration may be longer. It depends, among other things, on the viscosity of the liquid, the ambient pressure, the temperature or the tip opening. The dispensing speeds apply to single-channel pipettes and multi-channel pipettes from software version 2.06.00 upwards.

## 9.3 Test conditions

Test conditions and test evaluation in compliance with ISO 8655, Part 6. Tested using a standardized analytical scale with evaporation protection.

- Number of determinations per volume: 10
- Water according to ISO 3696
- Inspection at 20 °C – 25 °C
  - Maximum temperature variation during measurement ±0.5 °C
- Dispensing onto the tube inner wall
- Operating mode: Standard pipetting (PIP)
- Speed level: 5

The three largest testing volumes per tip (10 %, 50 %, 100 % of the nominal volume) correspond to the specifications in accordance with ISO 8655, Part 2 or Part 5. The test is to be carried out with these three testing volumes for testing of the systematic and random error in compliance with the standard. The smallest adjustable volume serves to provide additional information.
10 Transport, storage and disposal

10.1 Decontamination before shipment

**CAUTION! Use of a contaminated device may result in personal injuries and damage to the device.**

- Clean and decontaminate the device in accordance with the cleaning instructions before shipping or storage.

Hazardous substances are:

- solutions presenting a hazard to health
- potentially infectious agents
- organic solvents and reagents
- radioactive substances
- proteins presenting a hazard to health
- DNA

1. Please note the information in the document "Decontamination certificate for product returns".
   It is available as PDF document on our website www.eppendorf.com/decontamination.
2. Enter the serial number of the device in the decontamination certificate.
3. Enclose the completed decontamination certificate for returned goods with the device.
4. Send the device to Eppendorf AG or an authorized service center.

10.2 Storage

**NOTICE! Damage to device due to incorrect storage.**

- Remove the rechargeable battery if you will not be using the device for an extended period (> 2 months).
- Select a secure storage location.
- Do not expose the device to aggressive gases over an extended period.

10.3 Disposal

In case the product is to be disposed of, the relevant legal regulations are to be observed.

Information on the disposal of electrical and electronic devices in the European Community:

Within the European Community, the disposal of electrical devices is regulated by national regulations based on EU Directive 2002/96/EC pertaining to waste electrical and electronic equipment (WEEE).

According to these regulations, any devices supplied after August 13, 2005, in the business-to-business sphere, to which this product is assigned, may no longer be disposed of in municipal or domestic waste. They are marked with the following symbol to indicate this:

As disposal regulations may differ from country to country within the EU, please contact your supplier if necessary.

---

**WARNING! Risk of explosion and fire due to overheated rechargeable or other batteries.**

- Do not heat rechargeable batteries and other batteries to temperatures above 60 °C and do not throw them into a fire.

---

**Disposing of accumulators and batteries**

Do not dispose of accumulators and batteries as household waste.

Dispose of accumulators and batteries according to the locally applicable legal regulations.
